

Table 1

	Unhappy
0	27
1	19
2	10
3	3
4	3
5	3
6	4
7	4
8	4
9	5

The shape of the curve is like an elbow, where unhappy clients drop quickly with each added server up to a point, after which it basically levels out. From 0 - 3 servers, the number of unhappy clients decreases with the scaling out. And when the number of servers is over 3, scaling out does not help anymore. The plot suggest 3 servers is a good number for this load.
